

AOBE WORKTRACK

Backup Guide

Create, verify, restore, and move complete local records safely.

Local and private

No account, tracking, cloud database, API key, or internet connection is required for ordinary use.

What is protected

A complete JSON backup contains settings, shifts and breaks, trips, vehicles, jobs, expenses, notes, presets, saved-report metadata, and audit events. It includes a format version, creation timestamp, and SHA-256 integrity value. It contains no executable code.

Create a complete backup

- Open **Settings > Backup & import**.
- Choose **Back Up Now**.
- Select a safe destination if Windows asks, or keep the browser download.
- Copy the file to storage outside the device/browser profile.

Two layers

The app keeps up to ten automatic/manual local snapshots for recent mistakes. Downloaded backups protect against device loss or cleared browser storage. Use both.

Restore

- Choose **Choose backup file** and select the original JSON.
- Review creation time and counts for shifts, trips, vehicles, jobs, expenses, and notes.
- Choose **Restore backup**.
- The app creates a before-import safety snapshot, then replaces records/settings only after validation succeeds.

A damaged, edited, oversized, incomplete, or future-version file is safely rejected before data changes.

Move between desktop and web

Create a backup in the source version and restore it in the destination. Confirm counts before restore. Desktop and web do not automatically sync, so repeat this process when intentionally moving newer records.

CSV imports

CSV is for bringing shift or mileage rows from another source, not for complete recovery. Choose Shift data or Mileage data, review detected columns/warnings/duplicates, then import valid rows. A safety snapshot is created first. Formula-like cells are treated as text.

Recovery order

- Restore the newest trusted downloaded backup.
- If none exists, restore a recent local snapshot in Settings.
- If an export failed but the app still opens, do not clear storage; retry another path.
- Never manually edit backup JSON. Editing invalidates the integrity value.

Suggested routine

When	Action
Weekly	Download a complete backup and keep it outside the device.
Before import/restore	Create a fresh backup. The app also creates a safety snapshot.
Before changing computers	Back up, restore on the new computer, and compare record counts.
Before clearing browser data	Back up and verify the downloaded file is not zero bytes.

Sensitive records

Backups are not encrypted by the app. Anyone who can read the file can read its records. Store it in an encrypted drive or trusted secured folder when needed.
