

AOBE WORKTRACK

Installation Guide

Install the Windows app or the browser PWA without development tools.

Local and private

No account, tracking, cloud database, API key, or internet connection is required for ordinary use.

Windows installer

- Open **Aobe-WorkTrack-Setup-1.0.0.exe**.
- Follow the short per-user installer. Administrator access is not normally required.
- Launch Aobe WorkTrack from the Start Menu (or desktop shortcut when selected).
- Enter your name, set optional defaults, or choose Skip Setup and Start Tracking.

No setup tools

Aobe never needs Python, Node.js, Rust, SQLite, a command prompt, a server, an account, or an API key.

Portable version

Open the folder **Aobe-WorkTrack-Portable-1.0.0** and run the executable. Current Windows 10/11 includes the required WebView2 runtime. The program file can move, but its private SQLite data remains in the current Windows user's application-data folder. Use a backup to move records.

Install the web/PWA version

- Open the deployed Aobe WorkTrack URL in a current Chrome, Edge, Firefox, or Safari browser.
- Allow the first load to finish while online.
- Use the browser's Install app or Add to Home Screen command when available.
- Open the installed icon. The application shell now works offline.

First launch

Only a display name is expected. Hourly rate, mileage rate, currency, week start, time format, and distance unit are optional. All can be changed later without rewriting old records.

Updates

Ordinary Windows upgrades preserve the local app-data database. The PWA shows an Update ready notice when a new version is downloaded; choose Update when no form has unsaved changes. Back up before major upgrades.

Storage

- Windows: private SQLite database in the per-user Tauri application-data directory.
- Web/PWA: IndexedDB for the exact site origin and browser profile.
- No automatic synchronization exists between versions or devices.

Troubleshooting

- Windows reputation prompt: unsigned community builds can trigger the standard prompt. Confirm the file/checksum came from the trusted release source.
- Blank or stale PWA: reconnect, reload once, and accept the update prompt.
- Missing browser records: confirm the same URL and browser profile; preview and production URLs have separate storage.
- Export missing: allow downloads for the site or choose a different folder in the desktop file dialog.
- Restore rejected: use the original unedited backup file; integrity checking intentionally rejects modifications.
